of the present invention, at step 106, synthesizes a **portfolio** of
goods, services or **financial instruments** which is optimized to
fit

the preferences of each cluster of customers. In general, in...

...type. According to this invention, such searches are preferably
performed by starting from an initial **portfolio** and examining
neighboring portfolios for increased fitness. The distance to

neighboring
 portfolios, their direction, and...
 ...selected according to the 15 landscape parameters determining
 ruggedness or smoothness. If an improved **portfolio** is found, the
 search
 is started from that **portfolio**. The invention is adaptable to other
 search methods responsive to landscape parameters. For example, a...
 ...net customer preferences of the customers in a cluster for the
 components of a candidate **portfolio**. Another usual landscape is one
 that represents the feasibility of providing the candidate **portfolio**
 .
 For example, for goods or services, such feasibility can be
 represented
 by a landscape determined...
 ...an economic (for example, cost) or a technological (for example,
 manufacturability) function of the candidate **portfolio**. For
financial
instruments, the feasibility is an economic landscape responsive to
 the
 methods and costs of acquisition or...
 ...a function of, for example, the historic risk of loss for the goods
 in
 the **portfolio** in the geographic locations of the customers. In a
 preferred embodiment, optimization of multiple objectives is
 performed in
 order to reach a Pareto optimum. A Pareto optimum **portfolio** for
 multiple objectives is one such that any possible **portfolio** change
 will
 reduce the fitness of at least one objective even if the fitness of
 another objective is increased. Therefore, by combining multiple
 objectives
 according to a Pareto ranking or ordering, multiple objectives can be optimized for
 a
portfolio in a manner substantially identical to optimizing a
 single
 objective for a **portfolio**. 20 In the following, two alternatives
 are
 described for optimizing a single objective, which therefore...
 ...a value at risk (VaR). This alternative is particularly preferable
 to,
 for example, portfolios of **financial** instruments or of insurance
 services. For insurance services, historical statistical records on
 the
 risk of loss of possible assets to be insured is input to optimizing
 a
portfolio by limiting the VaR. For **financial instruments**,
 historical
 records of past transactions involving possible instruments is input.
 The
 following, without loss of generality, is directed primarily to the
 case
 of **financial instruments**, particularly publicly traded **stocks**

or

bonds . In detail, an initial **portfolio** can be generated from available historical data. The historical simulation method of the present alternative generates an initial **portfolio** of products based on historical data to minimize the value at risk of the **portfolio** . If historical data is not available, an initial **portfolio** can be generated consisting of the entire market of available products, and the remainder of...
...method can be skipped. Value at risk is a single, summary, statistical measure of possible **portfolio** losses. Alternatively in the goods context, one could substitute the total cost of the **portfolio** for value at risk, recognizing that some suppliers will discount cost for large orders of...

...probability. Using a probability of x percent and a holding period of t days, a **portfolio** 's value at risk is the loss that is expected to be exceeded with a...

...using historical changes in market rates and prices to construct a distribution of potential future **portfolio** profits and losses, and then determining the value at risk as the loss that is...

...the time. The distribution of profits and losses is constructed by taking a current initial **portfolio** , and subjecting it to the actual changes in the market factors experienced during each of...

...last N periods. Using these hypothetical values of market factors, N hypothetical mark-to-market **portfolio** values are computed. From this,

it is possible to compute N hypothetical mark-to-market profits and losses on the **portfolio** . - 21 The following discussion describes the

technique for isolating low value at risk portfolios. Consider a single

instrument **portfolio** , in this case **stocks** traded on the New York **Stock** Exchange and NASDAQ markets. For this instrument, there exists tremendous amounts of data. If we...

...the data we are interested in are the daily closing prices of every publicly traded **stock** on the two markets. Such data exists for thousands of **stocks** for tens of thousands of days. From these data, it

is possible to construct an m x n matrix (where m is the number of **stocks** , and n is the number of days) of prices. Within this collection

of **stocks** , there are pairs, triplets, quadruplets, etc., of **stocks** whose values at risk are lower as a group than any of the **stocks** individually. This occurs because sets of **stocks** whose price changes

are anti-correlated will have lower values at risk than the **stocks** individually. When the price of one **stock** goes down, the price of the other tends to go up. The chance that both **stocks** go down together is lower than the chance that two **stocks** chosen at random would go down together because the **stocks** are anti-correlated. This reduces value at risk. The optimal **portfolio** would group anti-correlated **stocks** in the optimal proportions to minimize value at risk. Because there are so many **stocks**, however, the space of all possible portfolios is too large to search exhaustively. Genetic algorithms...
...of time. The algorithm works as follows:
Step 1:
Start with m portfolios. Each **portfolio** can be represented as a vector of length m. Each bit (m) in the vector is either a 1 or a 0 signifying that the ith **stock** is either included or excluded from the **portfolio**.
This can later be extended to letting each bit specify the number of shares held rather than simply inclusion or exclusion. To each **portfolio**, assign a random number of stocks to hold such that every possible portfolio size is covered (at least one portfolio excludes all but one stock, at least one **portfolio** excludes all but two **stocks**, and so forth, and at least one **portfolio** includes all the **stocks**).
Once the number of **stocks** to hold has been assigned, let each **portfolio** randomly pick **stocks** until it has reached its quota.
Step 2:
Go back in time n/2 days...
...halfway point. - 22
Step 3:
Randomly pair portfolios. For each pair of portfolios, let the **portfolio** with the higher value at risk copy half of the bits of the lower value at risk **portfolio** (i.e. randomly select half of the bits in the more successful **portfolio**. If a bit is different, the less successful **portfolio** changes its bit to match the more successful **portfolio**).
The **portfolio** with the lower value at risk remains unchanged.
Step 4:
Repeat steps 2 and 3...
...a threshold for value at risk is achieved. In this way, clusters of anti-correlated **stocks** spread through the population of portfolios.

This method ultimately selects for most or all of the good clusters. Notice that this method may also alight upon the optimal number of **stocks** to hold in a **portfolio**. For 1 5 example, if the minimum VAR **portfolio** contains only three **stocks**, three- **stock** portfolios will tend to propagate through the population. Finally, the present invention optimizes the initial **portfolio** generated by using a method of sampling and selection to evaluate and minimize risk for...

...Abstract: framework of constraint logic programming has been developed in order to integrate these symbolic and **numerical** computations in a uniform way. The resulting system written in this language has the following **features**. (1) Unlike rule-based expert systems, the constraint-based system can **create** novel **investment** strategies. ...TEXT: chief executive presiding over Gillette Co.'s annual meeting, Wall Street gave the company's **stock** a beating yesterday the like of which it hadn't seen since the 1987 **stock** market crash. Gillette shares plunged 7 3- 4 to 50, responding to a **company** warning about reduced expectations for the first half of 1999 that had been issued the prior evening. Trading of Gillette **stock** was briefly delayed in the morning because a crush of sellers had created an order...

...of the year, Morgan Stanley Dean Witter analyst Catherine Lewis wrote yesterday.

Recommendations for Gillette **stock** were reduced by at least three brokerage analysts before trading began yesterday.

Gillette **stock** has been trading at prices that suggest explosive growth

in the near future, about 64 percent higher than the average Standard & Poor's 500 **stock** when measured in relation to future earnings

forecasts.

At the same time, the company's...

...first-quarter sales growth in the "low single digits."

The short analysis of yesterday's **stock** activity: Reality got the better

of expectations. The market may have overreacted to some degree...

...issue with Zeien's growth forecast doubt it is a good reason to value

Gillette **stock** substantially higher than that of other companies. Is jumping over a low bar so impressive...

...in a balky global economy. The question is whether they should remain

darlings of the **stock** market.

BACK ON THE SHELF: Numeric Investors will reopen two **funds** that were managed by John Bogle Jr. until he resigned from the Cambridge firm in February. **Numeric** 's \$96-million Micro **Cap fund** and its \$62-million

Growth **fund** will reopen to existing shareholders on April 19 and to everyone on May 17.

The **funds** have been closed since 1997, when they reached \$100 million in

assets. Numeric cited an increased **stock** market liquidity and "moderate"

redemptions connected to Bogle's departure as reasons to reopen the **funds**

.
